Tejas Kothari

Senior Software Engineer, Credibly · Bengaluru, India

linkedin.com/in/tejaskothari03 · github.com/tejas-k3

SKILLS

Languages & frameworks

Python, FastAPI, Django, Flask, Sanic, Java, Spring Boot, Go, TypeScript, React, SQL, LogQL

Systems & databases

Distributed systems, LLD, HLD, system design, microservices, PostgreSQL, Redis

Tools & others

AWS, Kubernetes, Docker, Helm, Prometheus, Grafana, Loki, Datadog, data structures, algorithms, multiprocessing, multithreading

WORK EXPERIENCE

Senior Software Engineer | Credibly — Present

- Work across the whole stack: backend, frontend and database. I pick up whatever comes my way.

Software Engineer 2 | CoinTracker — Dec 2025 – Apr 2026

- Led three blockchain integrations end to end (Bittensor, Starknet, Tezos) with full test coverage, opening new user segments and increasing revenue. **(3 integrations)**
- Found the upstream data issues behind balance discrepancies on five chains (Bittensor, Polygon, Cardano, Base, Solana) and fixed them, improving financial-data correctness. **(5 chains)**
- Built a code-generation tool for blockchain integrations, cutting setup time from one to two weeks down to two days. **(1-2 weeks → 2 days)**
- Reduced production failures through node failover, state-driven flows and removal of N+1 queries. **(-16% failures)**
- Hardened the CSV ingestion pipeline with race-condition handling, validation and accurate counters.

Software Development Engineer II | ObserveAI — Nov 2024 – Jul 2025

- Moved into core observability infrastructure: instrumented custom backend metrics and wrote Helm charts for Grafana and Datadog alerts, for real-time, cross-platform incident response.
- Added context-enriched logging to asynchronous Python services, making issues faster to find and resolve in a distributed environment.
- Engineered a load-testing framework for text-to-speech, speech-to-text and LLM vendor APIs, tuning configuration for accuracy, response time and cost.
- Defined Kubernetes service labels and log-aggregation standards for accurate scraping and unified collection across microservices.

Software Development Engineer II | 1mg — Mar 2024 – Nov 2024

- Decomposed the inventory-management codebase from a Ruby on Rails monolith into Python and Sanic microservices, reducing latency of the catalog-related APIs. **(-40% API latency)**
- Built a Tenant Management microservice to support a multi-tenant architecture.
- Designed a new schema that right-sizes the database for the SaaS model, for efficient storage and retrieval.

Software Engineer II | Sandvine — Jun 2021 – Feb 2024

- Built SQL-powered REST APIs to filter internet-activity data across 1M+ subscribers, driving higher user engagement. **(+40% engagement)**
- Devised a proprietary algorithm that detects social-media uploads in raw internet data. **(90% precision)**
- Wrote a state-management module that moves PCAP files through upload, validation, IP discovery and consolidation. **(30% faster)**
- Developed a configurable record-pruning module (by date range) for customers' on-premise deployments. **(up to 23 TB saved)**

PROJECTS

Rupee Engine — Feb 2026 – Present

- Built a CLI-based equity analysis system that scores the NSE universe (2,600+ stocks in a full run), combining fundamentals, technicals and sentiment in one pipeline.
- Designed a modular scoring engine with 13 pluggable algorithms and a risk/return-aware portfolio optimizer.
- Implemented async data pipelines with TTL caching and incremental refresh; cut backtest memory by 91% and slow-path run times by 50-70% with identical output. Python, FastAPI, PostgreSQL, httpx, asyncio, React.

System Design Playground — Oct 2026 – Present

- Built a deterministic discrete-event system-design simulator in Go (engine validated against queueing theory within 6-8%) with a React canvas UI, 108 guided challenges and shareable designs.

AOV Studios Website — Jun 2023 – Aug 2023

- Led and built a React single-page app for the studio's official website (aovstudios.co.in).

Twitter Malicious Bot Detection — Oct 2021

- Built a metric to identify malicious bots and botnets from a handle or hashtag; won "Most Radical Idea" among 40+ teams at Sandvine's 2021 hackathon, presented to a C-level panel.

EDUCATION

Vellore Institute of Technology — Aug 2017 – Jun 2021

B.Tech, Computer Science (CGPA 8.24)
